Extending Mubayi and Turán's Algorithm to k-graphs

Ferran Espuña

Let G be an r-graph with n vertices and $m = dn^k$ edges. A polynomial time algorithm is given to find a $K_{q,\dots,q} \subset G$ for

$$q(k,d) = \left\lfloor \left(\frac{\log n}{\log(2^k/d)}\right)^{\frac{1}{k-1}} \right\rfloor$$

As long as (insert condition here).

Note that this result is tight up to the constant $c(k,d)$, as proved in [1]. This result is a generalization of the result in 2-graphs by [3], and algorithm will be analogous to the one given there. This algorithm, referred to as $\texttt{FIND\_PARTITE}(k,\cdot)$, involves the following steps:

1. Choose parameters q, r, s depending on n, k and d.
2. Find the set R of r vertices with the highest degree in G.
3. find a subset $Q \subset R$ with q vertices and a $S \subset T := \binom{[n]\setminus Q}{k-1}$ with s edges satisfying
$$\{x_1, x_2, \dots, x_k\} \in E(G)\ \forall \{x_2, \dots, x_k\} \in S,\ x_1 \in Q$$
4. The set S induces a $(k-1)$-graph G' on T. Evaluate $\texttt{FIND\_PARTITE}(k-1, G')$ to find a $K_{q',\dots,q'}$ in G' (say, $H' = \{U_1, \dots, U_{k-1}\}$). It will turn out that $q' \geq q$, and because of the condition for S the k-partite subgraph $H = \{Q, V_1, \dots V_{k-1}\}$ is complete in G, where $V_i \subset U_i$ is a subset of size q. Return H.

For step 1, we will use the following formulas:

$$q(k,d) = \left\lfloor \left(\frac{\log n}{\log(2^k/d)}\right)^{\frac{1}{k-1}} \right\rfloor$$
$$r(k,d) = \left\lceil \frac{2q(k,d)}{d} \right\rceil$$
$$s(k,d) = \left\lfloor \left(\frac{d}{2}\right)^{q(k,d)} n^{k-1} \right\rfloor$$

The goal is to prove that the algorithm is successful and runs in polynomial time.

Lemma 1. *For this selection of parameters, there exist sets Q, S as described in step 3 of the algorithm.*

Proof. We first show that ther are at least drn^{k-1} edges in G with exactly one vertex in R. inded, ...

Now, consider the biparite graph with vertex set $\left(R, \binom{T}{k-1}\right)$ and edges corresponding to edges in G with exactly one vertex in R (and thus all others in T). The sets Q and S we want to find correspond to a complete bipartite subgraph of this graph with parts of size q and s respectively. Suppose that such a subgraph does not exist. [2] tells us then that

$$\begin{aligned} drn^{k-1} &< z\left(\binom{n-r}{k-1}, r; s, q\right) < (s-1)^{1/q}(r-q+1)\binom{n-r}{k-1}^{1-1/q} + (q-1)\binom{n-r}{k-1} \\ &\leq s^{1/q} r \binom{n}{k-1}^{1-1/q} + q\binom{n}{k-1} \leq s^{1/q} r \binom{n}{k-1}^{1-1/q} + \frac{1}{2} drn^{k-1} \end{aligned}$$

Where the last inequality follows from ...

Rearranging and approximating the binomial coefficient, we get

$$drn^{k-1} < 2s^{1/q} rn^{(k-1)(1-1/q)} \iff d < 2\left(\frac{s}{n^{k-1}}\right)^{1/q}$$

Which is false for the given choice of s.

$\square$

Lemma 2. *For this choice of parameters, $q' \geq q$.*

Proof. First we calculate a lower bond for the corresponding edge density d' in G':

$$d' = \frac{s}{(n-r)^{k-1}} \geq \frac{1}{n^{k-1}}\left(n^{k-1}\left(\frac{d}{2}\right)^{q(k,d)} - 1\right) \geq \left(\frac{d}{2}\right)^{\left(\frac{\log n}{\log(2^k/d)}\right)^{\frac{1}{k-1}}} - \frac{1}{n^{k-1}}$$

Therefore, we can bound q' as follows:

$$
\begin{aligned}
q' &\geq \left(\frac{\log n}{(k-1)\log 2 - \left(\frac{\log n}{\log(2^k/d)}\right)^{\frac{1}{k-1}} (\log d - \log 2)} \right)^{\frac{1}{k-2}} - 1 \\
&\geq \left(\frac{(\log n)^{1-\frac{1}{k-1}}}{\left(\frac{1}{\log(2^k/d)}\right)^{\frac{1}{k-1}} (k\log 2 - \log d)} \right)^{\frac{1}{k-2}} - 1 \\
&\geq
\end{aligned}
$$
