## Extending Mubayi and Turán's Algorithm to k-graphs

## Ferran Espuña

Let G be an r-graph with n vertices and  $m=dn^k$  edges. A polynomial time algorithm is given to find a  $K_{q,\ldots,q}\subset G$  for

$$q(k,d) = \left| \left( \frac{\log n}{\log(2^k/d)} \right)^{\frac{1}{k-1}} \right|$$

As long as (insert condition here).

Note that this result is tight up to the constant c(k, d), as proved in [1]. This result is a generalization of the result in 2-graphs by [3], and algorithm will be analogous to the one given there. This algorithm, referred to as FIND\_PARTITE $(k, \cdot)$ , involves the following steps:

- 1. Choose parameters q, r, s depending on n, k and d.
- 2. Find the set R of r vertices with the highest degree in G.
- 3. find a subset  $Q \subset R$  with q vertices and a  $S \subset T := {n \setminus Q \choose k-1}$  with s edges satisfying

$$\{x_1, x_2, \dots, x_k\} \in E(G) \ \forall \ \{x_2, \dots, x_k\} \in S, \ x_1 \in Q$$

4. The set S induces a (k-1)-graph G' on T. Evaluate FIND\_PARTITE(k-1,G') to find a  $K_{q',\ldots,q'}$  in G' (say,  $H'=\{U_1,\ldots,U_{k-1}\}$ ). It will turn out that  $q'\geq q$ , and because of the condition for S the k-partite subgraph  $H=\{Q,V_1,\ldots V_{k-1}\}$  is complete in G, where  $V_i\subset U_i$  is a subset of size q. Return H.

For step 1, we will use the following formulas:

$$q(k,d) = \left[ \left( \frac{\log n}{\log(2^k/d)} \right)^{\frac{1}{k-1}} \right]$$
$$r(k,d) = \left[ \frac{2q(k,d)}{d} \right]$$
$$s(k,d) = \left[ \left( \frac{d}{2} \right)^{q(k,d)} n^{k-1} \right]$$

The goal is to prove that the algorithm is successful and runs in polynomial time.

**Lemma 1.** For this selection of parameters, there exist sets Q, S as described in step 3 of the algorithm.

*Proof.* We first show that ther are at least  $drn^{k-1}$  edges in G with exactly one vertex in R. inded, . . .

Now, consider the biparite graph with vertex set  $(R, \binom{T}{k-1})$  and edges corresponding to edges in G with exactly one vertex in R (and thus all others in T). The sets Q and S we want to find correspond to a complete bipartite subgraph of this graph with parts of size q and s respectively. Suppose that such a subgraph does not exist. [2] tells us then that

$$drn^{k-1} < z \left( \binom{n-r}{k-1}, r; s, q \right) < (s-1)^{1/q} (r-q+1) \binom{n-r}{k-1}^{1-1/q} + (q-1) \binom{n-r}{k-1}$$

$$\leq s^{1/q} r \binom{n}{k-1}^{1-1/q} + q \binom{n}{k-1} \leq s^{1/q} r \binom{n}{k-1}^{1-1/q} + \frac{1}{2} drn^{k-1}$$

Where the last inequality follows from ...

Rearranging and approximating the binomial coefficient, we get

$$drn^{k-1} < 2s^{1/q}rn^{(k-1)(1-1/q)} \implies d < 2\left(\frac{s}{n^{k-1}}\right)^{1/q}$$

Which is false for the given choice of s.

**Lemma 2.** For this choice of parameters,  $q' \geq q$ .

*Proof.* First we calculate a lower bond for the corresponding edge density d' in G':

$$d' = \frac{s}{(n-r)^{k-1}} \ge \frac{1}{n^{k-1}} \left( n^{k-1} \left( \frac{d}{2} \right)^{q(k,d)} - 1 \right) \ge \left( \frac{d}{2} \right)^{\left( \frac{\log n}{\log(d/2^k)} \right)^{\frac{1}{k-1}}} - \frac{1}{n^{k-1}}$$
